‘Tackling Condensation’, a more comprehensive guide to the causes, diagnosis and remedies of condensation, is available for purchase from BRE, Garston, Watford WD2 7JR.

Telephone numbers for specific interests and enquiries are as follows:

BRE Bookshop (BRE publications) - 01923 664444
General and technical advice - 01923 664664

If you are a Council tenant and wish to receive help with any remedial work, you should approach Housing Services direct. Please phone 0800 833161.
Is your home DAMP?

Damp can cause mould on walls and furniture and make timber window frames rot. Damp housing encourages the growth of mould and mites, and can increase the risk of respiratory illness.

Some damp is caused by condensation. This leaflet explains how condensation forms and how you can keep it to a minimum, so reducing the risk of dampness and mould growth.

USEFUL INFORMATION

- Useful information on effective ways to heat and insulate your home can be obtained from the Energy Savings Trust (Tel: 0870 241 2089).

- If you are a householder who receives a qualifying income or disability related benefits, you may be eligible for a grant for the installation of a major insulation measure such as draughtproofing, loft insulation (where your existing insulation is no more than 100mm (4 inches) thick), or cavity wall insulation, under the Warmfront Scheme.

- Such grants may also be available to assist the above owner occupiers with heating repairs or, if they are over 60, with the first time installation of gas fired central heating.

- For information on grants under the Warmfront Scheme, telephone the free Grants Helpline on 0800 316 2814 (or contact Eaga Partnership Ltd, FREEPOST NEA 12054, Newcastle-upon-Tyne, NEZ 1BR).

- If you are an owner-occupier in receipt of benefits or are disabled or infirm, you may be eligible for housing assistance grant to improve the ventilation within your home from Southend-on-Sea Borough Council. Telephone the Grants Support Service on (01702) 215815.

- Further related information can also be found on the Council’s own website at www.southend.gov.uk/content.asp?content=1212

- If dampness has caused window frames in your home to rot, you can treat the wood with preservatives. A leaflet entitled, "Wood Preservatives in Your Home", gives valuable advice on the use of these chemicals. Copies of this leaflet from the former Department of the Environment are currently available from the Private Sector Housing Service. It is important to remember, however, that the only lasting remedy for wood rot is to cure the damp which caused it in the first place.
Some words of warning:

DO NOT BLOCK PERMANENT VENTILATORS;

- Do not completely block chimneys. Instead, leave a hole about two bricks in size and fit a louvred grill over it;
- Do not draughtproof rooms where there is condensation or mould;
- Do not draughtproof a room where there is a cooker or a fuel burning heater, for example, a gas fire;
- Do not draughtproof windows in the bathroom and kitchen.

FIRST STEPS AGAINST MOULD

- First treat any mould you may already have in your home. If you then deal with the basic problem of condensation, mould should not reappear.
- To kill and remove mould, wipe down walls and window frames with a fungicidal wash which carries a Health and Safety Executive ‘approval number’. Follow the manufacturer’s instructions precisely. Dry-clean mildewed clothes and shampoo carpets. Disturbing mould by brushing or vacuum cleaning can increase the risk of respiratory problems.
- After treatment, redecorate using a good quality fungicidal paint to help prevent mould recurring. Note that this paint is not effective if overlaid with ordinary paints or wallpaper.

The only lasting way of avoiding severe mould is to eliminate dampness.

What is CONDENSATION?

There is always some moisture in the air, even if you cannot see it. If the air gets colder, it cannot hold all the moisture and tiny drops of water appear. This is condensation. You notice it when you see your breath on a cold day, or when the mirror mists over when you have a bath.

Condensation occurs mainly during cold weather, whether it is raining or dry, it does not leave a ‘tidemark’. It appears on cold surfaces and in places where there is little movement of air. Look for it in corners, on or near windows, in or behind wardrobes and cupboards. It often forms on north-facing walls.

Is it CONDENSATION?

Condensation is not the only cause of damp. Dampness can also come from:

- Leaking pipes, wastes or overflows;
- Rain seeping through the roof where a tile or slate is missing, spilling from a blocked gutter, penetrating around window frames, or leaking through a cracked pipe;
- Rising damp due to a defective damp-course or because there is no damp-course;

These causes of damp often leave a 'tidemark'.

If your home is newly built it may be damp because the water used during its construction (for example, in plaster) is still drying out.

If your home is damp for any of these reasons it may take weeks of heating and ventilation to dry out. Hiring a dehumidifier will help.

If you do not think the damp comes from any of these causes, then it is probably condensation.
How to avoid CONDENSATION

These three steps will help you reduce the condensation in your home.

1. Produce less moisture

Some ordinary daily activities produce a lot of moisture very quickly.

- Cover pans and do not leave kettles boiling;
- Avoid using paraffin and portable flueless bottled gas heaters as these heaters put a lot of moisture into the air;
- Dry washing outdoors on a line, or put it in the bathroom with the door closed and the window open or fan on;
- Vent any tumble dryer on the outside, unless it is the self-condensing type. DIY kits are available for this.

2. Ventilate to remove moisture

- You can ventilate your home without making draughts.

- Keep a small window ajar or a trickle ventilator open when someone is in the room;
- Ventilate kitchens and bathrooms when in use by opening the windows wider. Or better still, use a humidistat-controlled electric fan. These come on automatically when the air becomes humid, and are cheap to run;

3. Insulate, draughtproof and heat your home

Insulation and draughtproofing will help keep your home warm and will also cut fuel bills. When the whole home is warmer, condensation is less likely.

- Insulate your loft. Remember to draughtproof the loft hatch but do not block the opening under the eaves.
- Consider cavity wall insulation. Before deciding though, you should talk to the Building Control Officer as building regulations approval is required;
- Consider secondary and double glazing of windows to reduce heat loss and draughts but you must ensure that there is some ventilation;
- In cold weather, keep low background heating on all day, even when there is no one at home.
How to avoid CONDENSATION

These three steps will help you reduce the condensation in your home.

1. **Produce less Moisture**

   Some ordinary daily activities produce a lot of moisture very quickly.
   - Cover pans and do not leave kettles boiling;
   - Avoid using paraffin and portable flueless bottled gas heaters as these heaters put a lot of moisture into the air;
   - Dry washing outdoors on a line, or put it in the bathroom with the door closed and the window open or fan on;
   - Vent any tumble dryer on the outside, unless it is the self-condensing type. DIY kits are available for this.

2. **Ventilate to remove moisture**

   - You can ventilate your home without making draughts.
     - Keep a small window ajar or a trickle ventilator open when someone is in the room;
     - Ventilate kitchens and bathrooms when in use by opening the windows wider. Or better still, use a humidistat-controlled electric fan. These come on automatically when the air becomes humid, and are cheap to run;
     - Close the kitchen and bathroom doors when these rooms are in use, even if your kitchen or bathroom has an extractor fan. A door closer is advisable, as this will help prevent moisture reaching other rooms, especially bedrooms, which are often colder and more likely to get condensation.
     - Ventilate cupboards and wardrobes. Avoid putting too many things in them as this stops the air circulating. Cut a ventilation slot in the back of each shelf or use slatted shelves. Cut ‘breather’ holes in doors and in the back of wardrobes and leave space between the back of the wardrobe and the wall. Where possible, position wardrobes and furniture against internal walls.
     - If you replace your window units at any time, make sure that the new frames incorporate trickle ventilators.

3. **Insulate, draughtproof and heat your home**

   Insulation and draughtproofing will help keep your home warm and will also cut fuel bills. When the whole home is warmer, condensation is less likely.
   - Insulate your loft. Remember to draughtproof the loft hatch but do not block the opening under the eaves.
   - Consider cavity wall insulation. Before deciding though, you should talk to the Building Control Officer as building regulations approval is required;
   - Consider secondary and double glazing of windows to reduce heat loss and draughts but you must ensure that there is some ventilation;
   - In cold weather, keep low background heating on all day, even when there is no one at home.
Some words of warning:

DO NOT BLOCK PERMANENT VENTILATORS;
